Website Healthcare: Is your website Safe?

More than 6,000 websites are blacklisted by Google, Bing, Yahoo and others every day because hackers infect these websites with malicious code. Once blacklisted, browsers like Firefox, Internet Explorer, and Safari block access to the compromised website leading to a drop in sales and destroying the reputation of a website. Furthermore, before your website is blacklisted, the injected malicious code may have infected your customers or compromised sensitive data on your website.

Stopthehacker's SaaS security services protect your website and safeguard your online business' reputation, helping increase your revenue and reducing downtime. A unique feature, compared to similar services, is that it can detect never-before-seen malware, essentially catching zero-day malware outbreaks.

Pick the right product(s) for your site:

- **Website Health Monitoring:** Scans your website daily to determine if a hacker has injected malicious code on your website so you can take action before you get blacklisted and before infecting your customers. This scan hunts down any malware silently deposited on your website by a malicious hacker. Receive detailed reports hightlighting the specific code causing the problem (incl. line number), and procedures to recover from the infection. This service includes Reputation Monitoring.

- **Vulnerability Assessment :** Scans your website weekly to determine if your site is vulnerable so you can take action before a hacker exploits it. We check over 35,000 vulnerabilities on your servers, website and infrastructure. This service helps you beat back the hackers before they even try to get to you. This service includes Website Health Monitoring.

- **Reputation Monitoring:** a daily check to show you what the Internet thinks about your website. We check multiple blacklists ranging from malware to DNS, spam, phishing, fraud, child safety, SSL reputation, IP reputation and much more. Find out how the Internet perceives your website.

- **Google Blacklist Monitoring:** a daily check on the status of your website on the Google Safe Browsing List. We notify you so that you can take action before your visitors are hurt and to remove your site from the search engine blacklist. Get instant alerts if your site gets blacklisted.

All services run outside the firewall so there is no software to install! These services are complementary to, but entirely different from anti-spam, anti-virus, or network firewalls. We are focused on web security, and our proprietary, patent-pending technology has been recognized by multiple awards from the National Science Foundation.
